

5G-MOBIX French Trial Site's results and lessons learnt on 5G for CAM

FR Site contributions to the Cross Borders Issues

Pierre Merdrignac
20 June 2022

5GMOBIX

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No. 825496.

Overview of FR Test Cases

Category	Cross-Border Issues	Solutions	Tests Cases & Scenarios
Telecom & Application	NSA Roaming Interruption	Handover using an NSA network	Single-SIM and Multi-SIM Connectivity with different technologies & networks
	Session & Service Continuity	Multi-modem / multi-SIM modem	
	Low Coverage Area	Use of satellite solution	
Telecom	mmWave Applicability	mmWave 5G NSA network	User Story: Infrastructure -assisted advanced driving 4G / 5G sub 6GHz / 5G mmWave
Application	Dynamic QoS Continuity	Predictive QoS	QoS adaptation to performances changes due to roaming/handover

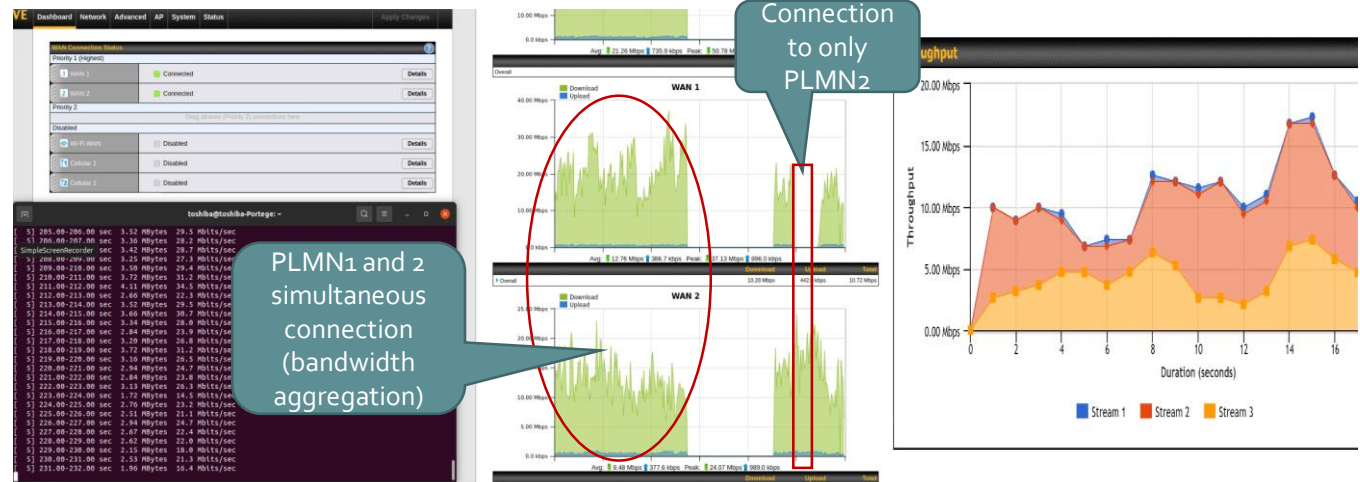

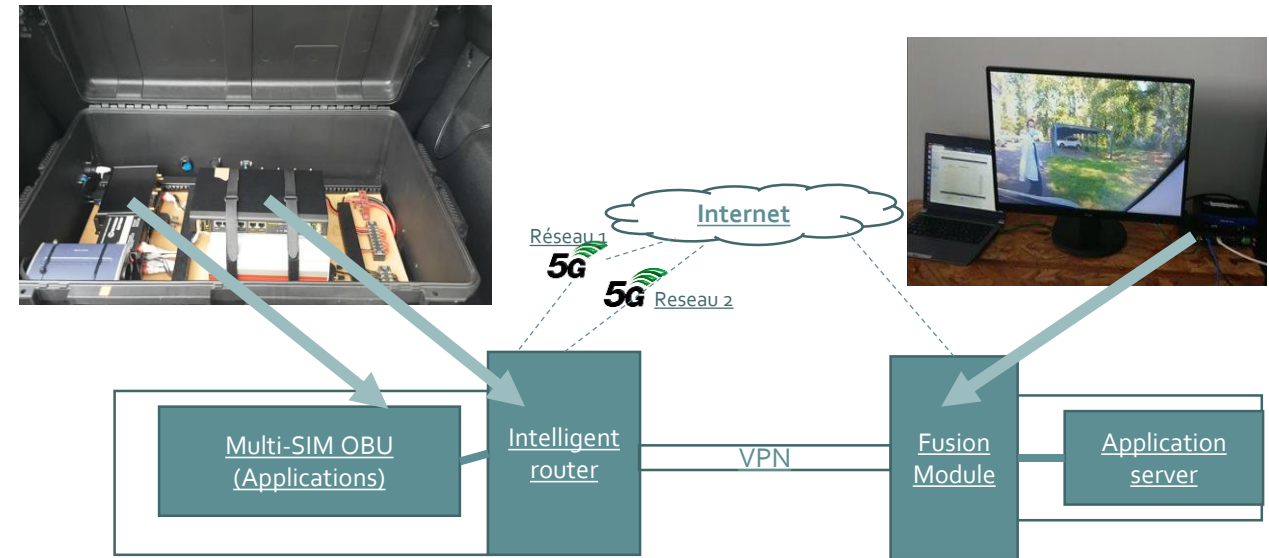

Results of Multi-SIM Connectivity

Scenarios

Multi-SIM Connectivity Solution

- Connected Vehicle with intelligent router
 - Simultaneous connection with two 5G Networks
 - Reduction (suppression) of the delay associated with roaming/handover
 - Aggregation of multiple connexions
 - Increase of throughput
- MEC / Cloud Server
 - Fusion of the received data
 - Reordering of packets send to applications.

Tests in France

Delay penalty:

- 30 ms for UDP flow
- 150 ms for TCP flow

- T₀ : 1st SIM connected to network 1
- T₁ : 2nd SIM connected to network 2
 - Packets send to both interfaces.
- T₂ : 1st SIM disconnected to network 1

- 1% -6% penalty for packet loss

FR-TS Seamless handover test

Transmitted video

Received video

Test in Spain-Portugal Cross-Border Corridor

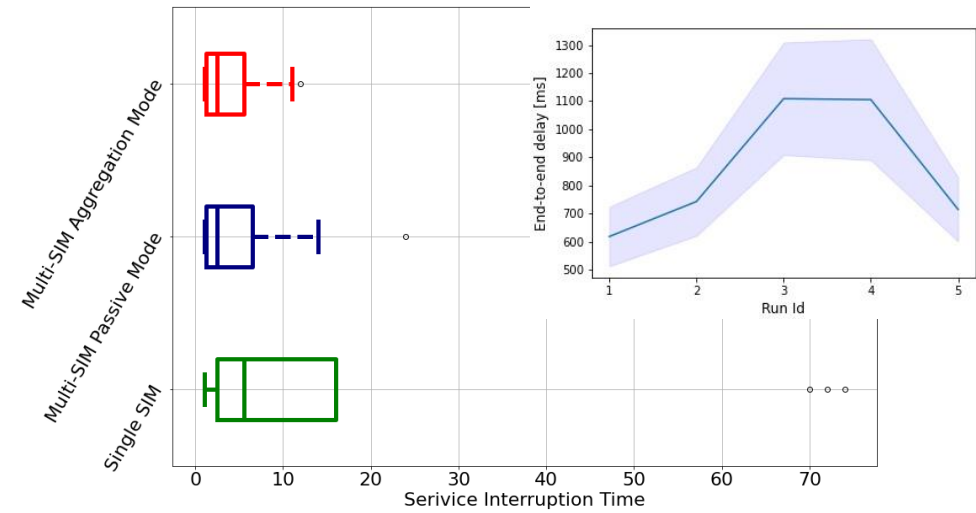

- CV is installed with an intelligent router which interfaces double SIM 5G OBU: the first SIM from Telefonica, and the second SIM from NOS.
- CV are sends UDP flows to a server at 10Mbps to a data fusion server installed in France
- **Results**
 - Multi-sim connectivity with link aggregation provides the highest performance for service continuity
 - Given good network conditions, multi-sim connectivity can ensure service availability
 - Important impact related to the location of the monitoring server on the delay

SP network
(Telefonica)

PT network
(NOS)

Experimental networks with low coverage at the border

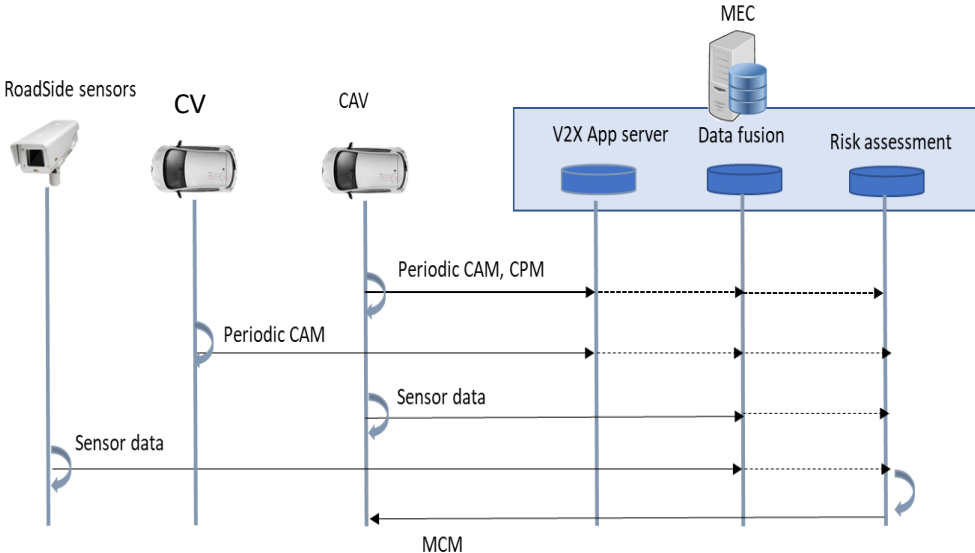

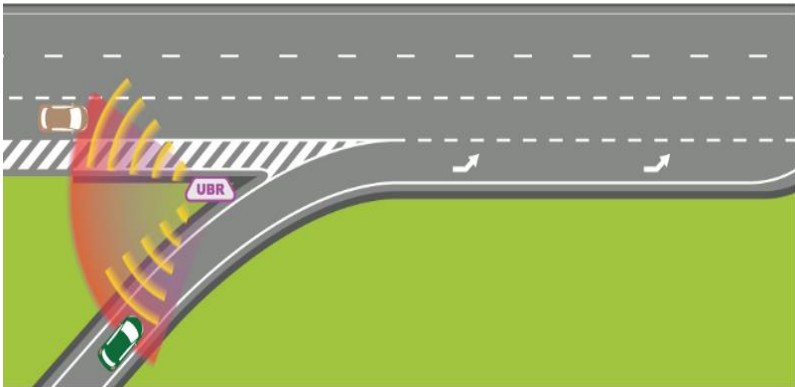

Usage of satellite technology

- Iridium Certus LEO Constellation
 - Thales Iridium Certus-350 Land Mobile (up to 500 kbps)
 - Worldwide coverage almost 100 % (inc. Polar regions)
- Vehicle with on-board equipment
 - 5G on-board unit
 - Satellite terminal
 - Intelligent router
- Results
 - Satellite communication should be used in a back-up solution when terrestrial 5G technology is not available
 - Higher latency (few hundreds ms) and some packets loss have been experienced
 - When used with multi-SIM modem, connectivity with VPN server can be maintained

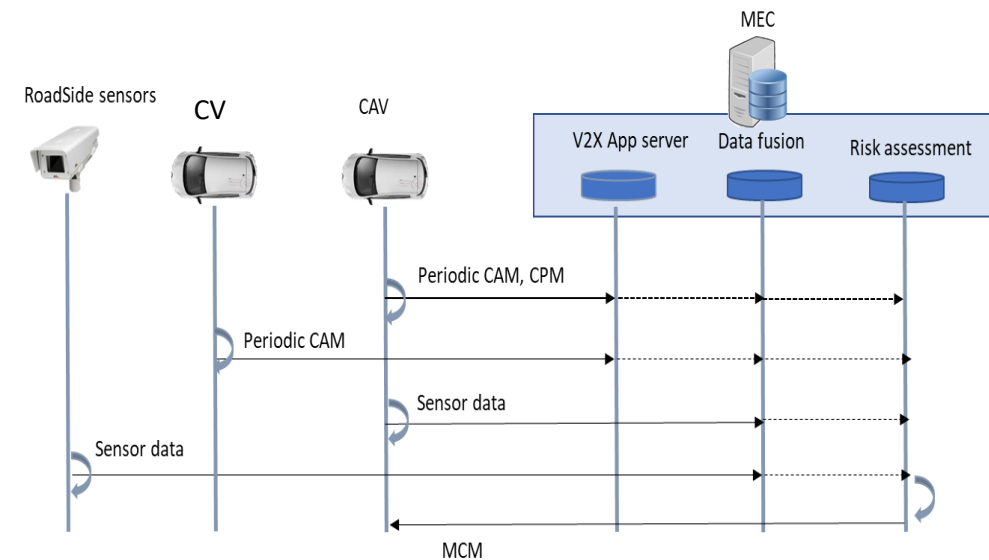

User Story: Infrastructure -assisted advanced driving

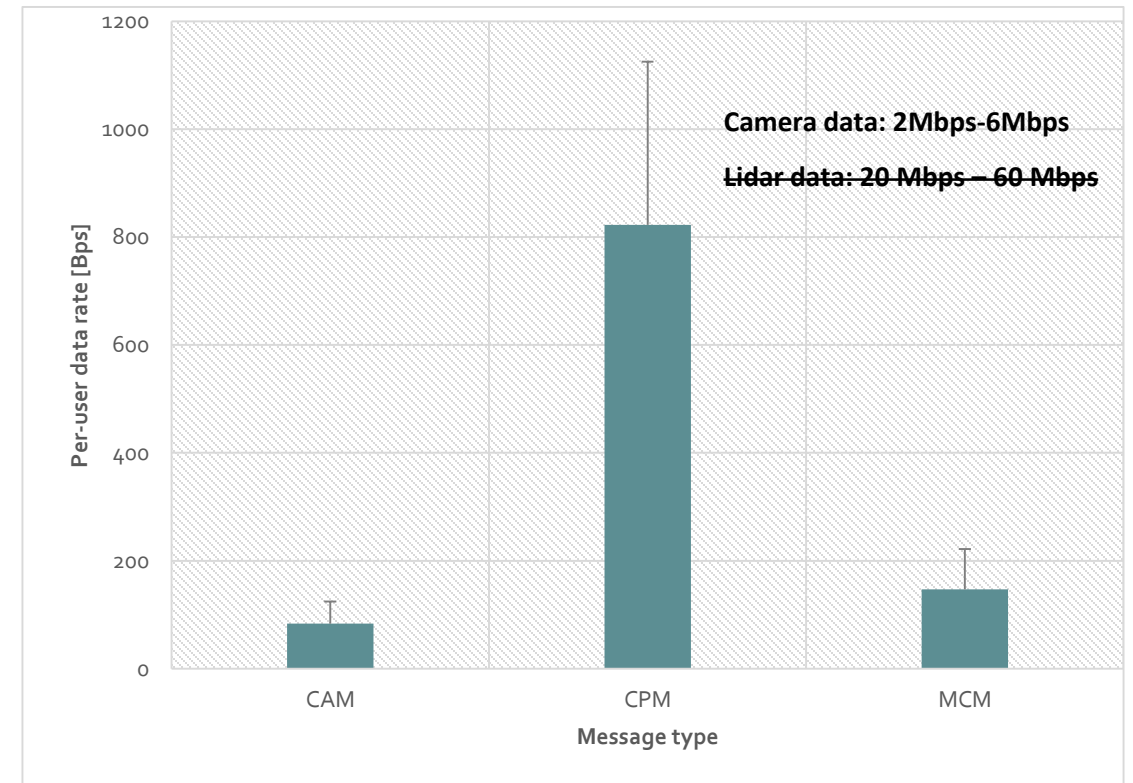

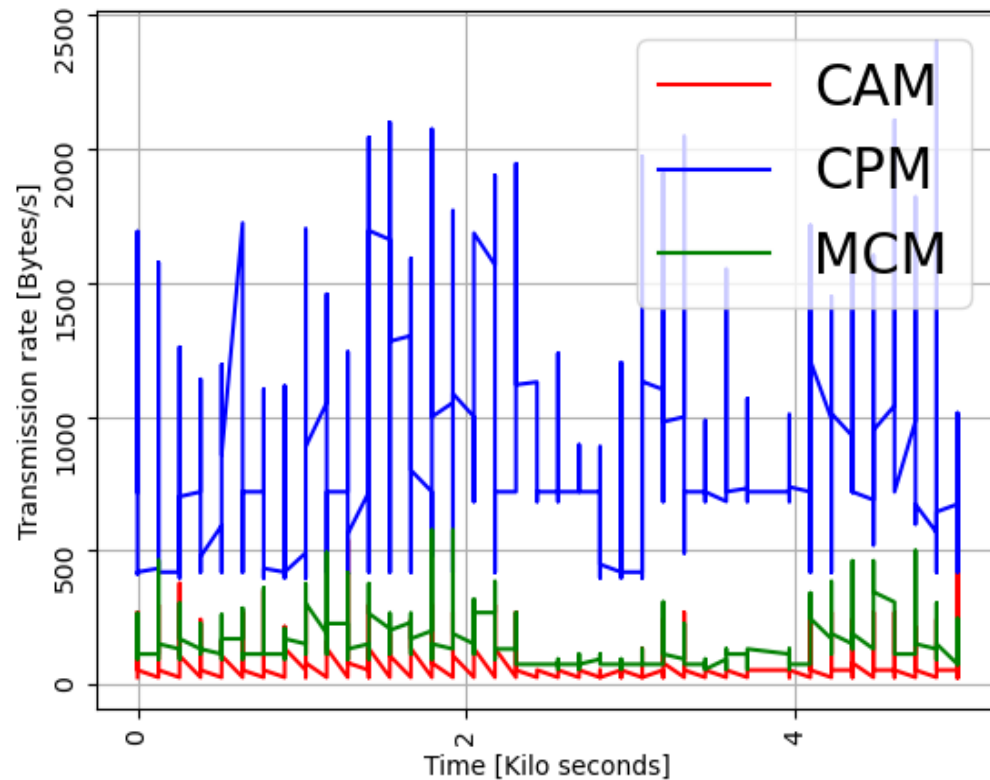

- Scenario
 - 1 CAV driving on main road
 - Send CAM / CPM to MEC installed in infrastructure
 - 1 Vehicle on insertion lane
 - Detected by roadside sensor
 - V2X applications installed in MEC to assist CAV in driving tasks
 - Fusion of data messages and assessment of situation and lane merging
 - MEC sends trajectory recommendation to CAV via MCM
 - Indicated lane change when conflicts detected with other vehicle

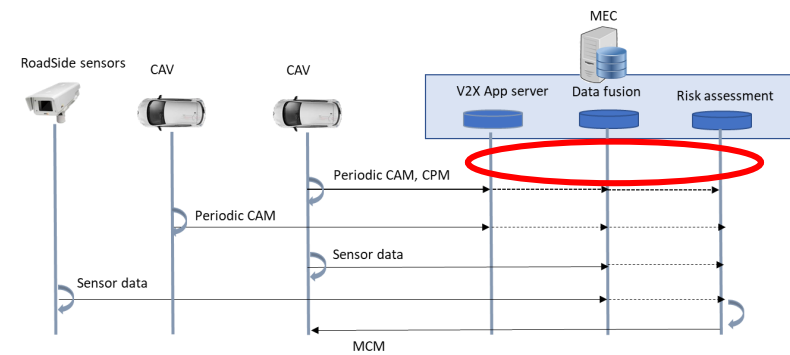

- Scenario
 - 1 CAV driving on main road
 - Send CAM / CPM to MEC installed in infrastructure
 - 1 Vehicle on insertion lane
 - Detected by roadside sensor
 - V2X applications installed in MEC to assist CAV in driving tasks
 - Fusion of data messages and assessment of situation and lane merging
 - MEC sends trajectory recommendation to CAV via MCM
 - Indicated lane change when conflicts detected with other vehicle

Throughput of V2X Communication (3 vehicles)

Processing delay in MEC

Monitoring system : extended perception, risk assessment, maneuver coordination

Processing delay on MEC for data fusion and analysis

Performance in end-to-end latency

4G Technology

- Average: 29.07 ms
- Median: 28 ms
- Standard Deviation: 9.37 ms

5G Technology (NSA)

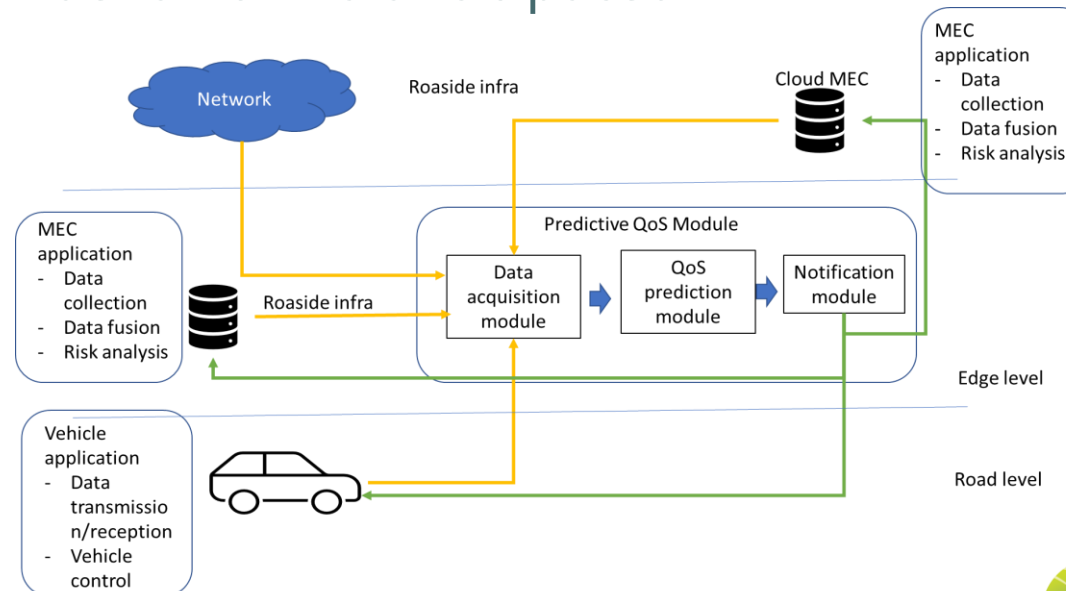

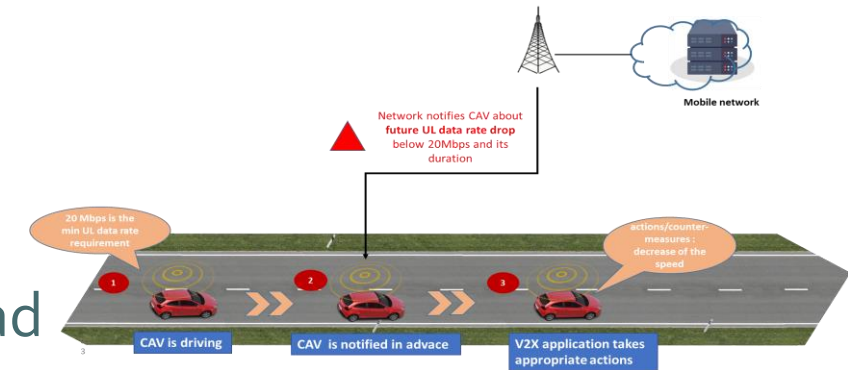

- Average: 12.15 ms
- Median : 11.517 ms
- Standard deviation: 2.885 ms

Potential improvement to come (SA, slicing, URLLC, spectrum with mmWave)

QoS adaptation to performances changes due to roaming/handover

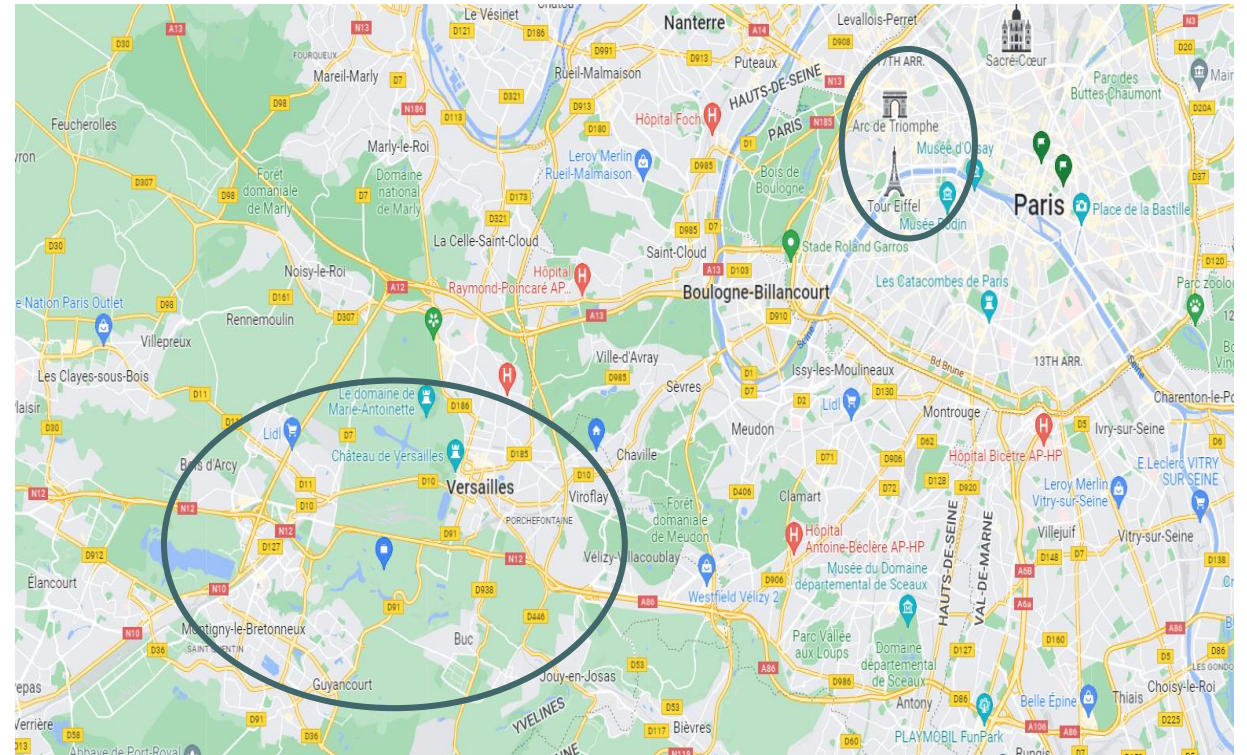

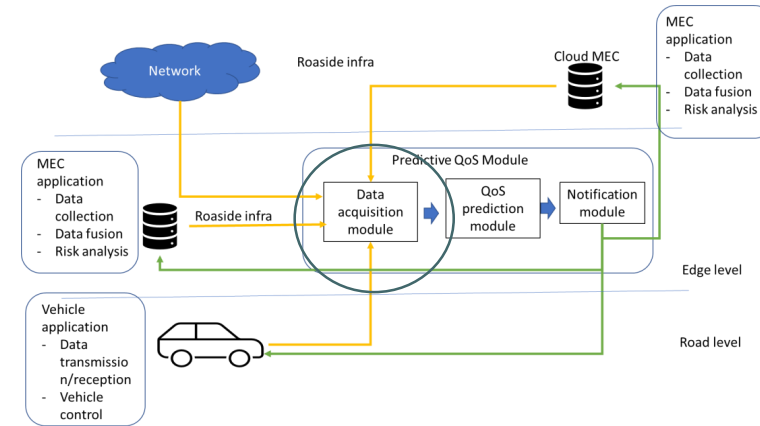

- Predictive QoS modules

- Installed in MEC at FR TS
- Predict communication performances based on modeled learned from dataset collected in open road
- Request users to adapt their behavior via anticipated QoS notification (IQN)

Data acquisition

- Location
 - Versailles
 - Paris
 - Guyancourt
- Modems
 - SIMCOM OBU 5G
 - Téléphone Samsung S21
- Content
 - Timestamps, location, speed
 - Access, network, application KPIs

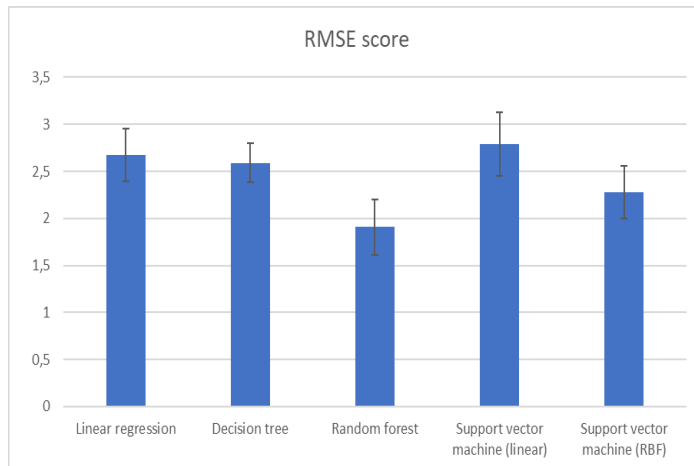

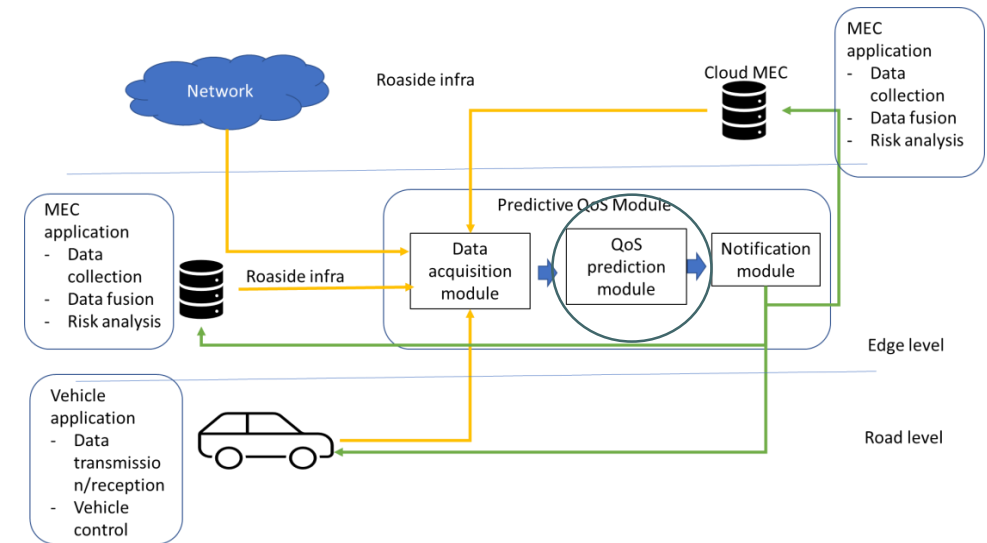

Data analysis

- QoS prediction do not rely on a parametric model with a unique parameter
- Combined impact of multiple parameters need to be considered

Model learning

- Multiple supervised learning models used
- Based on RMSE score, random forest provides higher performances
- Fine tuning of model needed

Real throughput [Mbps]	Predicted throughput [Mbps]
6,996	6,21526
10,574	9,28
7,48	7,04
13,89	13,06
21,519	17,34

QoS Notification

- Notification of predicted QoS using IQN message specified in FR TS
- What can be controlled?
 - V2X messages: low transmission rate
 - Video: required fine adaptation of transmission parameters

QoS Client Module 3601: current position (48.787, 2.08732), timestamp=1650459540, IQN received, data rate adaptation to 9 Mbps

```

Conclusion

Category	Cross-Border Issues	Solutions	Outcomes
Telecom & Application	NSA Roaming Interruption	Handover using an NSA network	Intelligent combination of multiple technologies can be used to ensure service continuity for vehicle applications
	Session & Service Continuity	Multi-modem / multi-SIM modem	
	Low Coverage Area	Use of satellite solution	
Telecom	mmWave Applicability	mmWave 5G NSA network	5G mmWave has potential be used in dedicated areas to support V2X applications Only initial experimentation could be done
Application	Dynamic QoS Continuity	Predictive QoS	Important to collect data at high resolution with their geolocation Adaptation of application configuration to the radio environment can become possible

Thank you
